SUPPORTPILOT AI

Customer support that answers, checks orders, and hands off — safely

One script tag on your website. Your documents. Your customers' own orders. Your team, one click away.

THE PROBLEM

Support teams are buried in questions they have already answered

1

Repetitive volume

Return policies, opening hours, shipping times — the same questions, every day, answered by people.

2

“Where is my order?”

Order-status requests dominate the queue and need a login, so generic FAQ bots cannot help.

3

Slow, uneven service

Customers wait for a human, after hours get nothing, and quality varies agent to agent.

4

Lost context

Tickets arrive without the conversation, so agents re-ask and customers repeat themselves.

WHY EXISTING BOTS DISAPPOINT

Most chatbots fail the moment a customer needs something real

Typical website chatbot

- Guesses when it does not know — and sounds confident
- Generic knowledge, not your policies
- Cannot see orders, or sees anyone's
- Dead end: “please email us”

SupportPilot AI

- Answers only from your documents, with source citations
- Confidence gate: if unsure, it says so and escalates
- Shows a customer only their own orders
- Files a ticket or hands to a person — with full context

WHAT IT DOES

One assistant, four jobs your customers actually need done

Answers from your docs

Upload your policies and FAQs. Replies cite the exact source passage.

Checks order status

Signed-in customers ask about their own orders in plain language.

Opens support tickets

Confirms with the customer, then files in Jira with the transcript attached.

Hands off to a person

Button, keyword, or automatic after repeated misses. Live agent console.

HOW IT WORKS

Live on your site in four steps, no engineering project

1

Add one tag

Paste a single script tag on your website.

2

Add your docs

Drop in policies and FAQs, or upload via the admin API.

3

Connect

Pick your AI provider; link orders and Jira.

4

Go live

Customers chat; your team takes over when needed.

New customers (tenants) are onboarded with configuration only — each gets an isolated knowledge base, branding, and agents.

BUILT FOR TRUST

Customers can only ever see their own orders

Identity comes from your backend, not from the chat — and not from the AI.

1

Signed identity

Your server issues a short-lived signed token. A forged, expired, or other-company token is rejected.

2

AI cannot choose whose data

Order lookups never take a customer id from the model — it is injected server-side.

3

No information leaks

Someone else's order and a non-existent order look identical to the asker.

4

Everything audited

Every lookup is logged. Each company's data is fully isolated.

HUMAN HANDOFF

Humans stay in control — customers are never stranded

Bot
AI handles it

›

Waiting
Queued for an agent

›

With human
Agent replies live

›

Resolved
Closed, or back to bot

Customer asks

“Talk to a human” button or phrase

AI decides

Sensitive or unresolved issue

Automatic

Repeated misses, or a model outage

WHO IT IS FOR

Built for businesses where support volume is a cost centre

E-commerce & retail

Order status, returns, delivery questions

Subscription & SaaS

Policy, billing, how-to questions

Service businesses

Hours, bookings, pricing, FAQs

What you gain

- Fewer repetitive tickets
- Faster answers, around the clock
- Agents focus on hard cases
- Your choice of AI provider
- Designed for ~30,000 conversations a day

NEXT STEP

Start with a pilot on your own documents

1. Week 1 — load your FAQs and policies; try it in a sandbox
2. Week 2 — connect orders and Jira; invite your agents
3. Week 3 — go live on a slice of traffic and review results

Production go-live is gated by the built-in readiness evaluation (security, accuracy, resilience, load).
